

Task 2

1. The Hybrid Debate

Q1. What is the difference between Native and Hybrid apps in terms of performance?

Answer: Native apps usually provide better performance because they are developed specifically for one platform. Hybrid apps may have slightly lower performance because they use a shared codebase.

Q2. What is the difference in development cost?

Answer: Native apps are generally more expensive because separate development may be required for Android and iOS. Hybrid apps are cheaper because developers can reuse the same code.

Q3. Which approach has a faster time to market?

Answer: Hybrid apps usually have a faster time to market because one codebase can be used for multiple platforms.

Q4. How do they differ in access to device features?

Answer: Native apps have direct and excellent access to features such as the camera, GPS, and Bluetooth. Hybrid apps can also access these features using plugins, but some advanced features may require extra work.

Q5. Which approach is easier to maintain?

Answer: Hybrid apps are generally easier to maintain because developers can update the shared codebase instead of maintaining separate applications.

Q6. What is the biggest advantage of Hybrid development for companies?

Answer: The biggest advantage is code reusability. Companies can reuse the same code across different platforms, which saves time, development effort, and cost.

2. Strategic App Choice

Q1. Which development approach would you recommend for the car hire app MVP?

Answer: I would recommend a Hybrid approach.

Q2. Why would you choose Hybrid for the MVP?

Answer: An MVP is designed to test the market using the core features of a product. Hybrid development allows the car hire app to be developed faster and at a lower cost while supporting multiple platforms.

Q3. Why not choose Native?

Answer: Native development provides excellent performance and device access, but it can take more time and cost more when separate Android and iOS versions are required.

Q4. Why not choose Web?

Answer: A Web app can be quick and inexpensive, but it may not provide the same mobile experience and device integration as a mobile application.

Q5. What is the final justification for choosing Hybrid?

Answer: Hybrid is suitable because the main goal of the MVP is to quickly test the car hire idea with core features such as adding members and hiring cars, while keeping development time and cost relatively low.
